Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-! FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodelling and degratedation, in cell migration and many other physiopathological events.

-! CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in

                                        -!- SUBCELLULAR LOCATION: Secreted, extracellular.
-!- PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURT.
PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFT.
ARG-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.
-!- MISCELLANBOUS: Bands to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 EGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SMARY; SM00020; Tryp. "Catalytic domain structure of vampire bat plasminogen activator: a
"Catalytic domain structure of vampire bat plasminogen activator: a
molecular paradigm for proteolysis without activation cleavage.";

E Biochemistry 36.13483-13493 (1997).

E Biochemistry 36.13483-13493 (1997).

-!- FUNCTION: Probably sesential to support the feeding habits of this exclusively haematophagous animal. Potent thrombolytic agent.

-!- FUNCTION: Probably sesential to support the feeding habits of this plasminogen to form plasmin.

-!- CATALYTIC STORING ACTIVITY: Specific cleavage of Arg-|-Val bond in plasmin.

-!- ENZYME REGULATION: Activity toward plasminogen is stimulated in the krimgle domain apparently mediates fibrin-induced activity.

-!- SUBJUNT: Monomer:

-!- SUBJUNT: Monomer:

-!- SIMILARITY: Contains I EGF-like domain.

-!- SIMILARITY: Contains I Eff-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SALIVARY PLASMINOGEN ACTIVATOR ALPHA 1.

PROFIN: THE SIRGLE CHAIN, ALMOST FULLY ACTIVE BNZYME, CAN BE FURTHER PROCESSED INTO A TWO-THAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

SINGSELLAMBOOUS: Bands to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.

SIMILARITY: Contains I EGF-like domain.

SIMILARITY: Contains 1 Eibronectin type I domain.

SIMILARITY: Contains 2 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rattus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                       -!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- ENZYME REGULATION: Activity toward plasminogen is stimulated in the presence of fibrin I.
-!- DOMAIN: Monomer.
-!- DOMAIN: The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced stimulation of activity.
-!- SIMILARITY: Belongs to peptidase family SI.
-!- SIMILARITY: Contains I EGF-like domain.
-!- SIMILARITY: Contains I fibronectin type-I domain.
-!- SIMILARITY: Contains I fibronectin type I domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SALIVARY PLASMINOGEN ACTIVATOR ALPHA 2. FIBRONECTIN TYPE-I. EGF-LIKE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and tPA.";
Int. Darity U. 5:605-617(1995).
-!-CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- INDUCTION: By retinoic acid.
-!- SIMILARITY: Delongs to peptidase family S1.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Bovine urokinase-type plasminogen activator and its receptor: cloning and induction by retinoic acid.";

of two chains, A and B. The high molecular mass form contains a long chain A. Cleavage occurs after residue 155 in the low molecular mass form to yield a short Al Chain.

PHARMACENTICAL: Available under the name Abbokinase (Abbott). Used in Pulmonary Embolism (PE) to initiates fibrinolysis.

SIMILARITY: Belongs to peptidase family S1.

SIMILARITY: Contains 1 EGF-like domain.
SIMILARITY: Contains 1 kringle domain.

                                            A.Contents: annotation, beta-hydroxyaspartic acid
C.Comment: Protein C is the zymogen of the vitamin K-dependent serine proteinase that in
ivation of factor Va is strongly enhanced by complexing with protein S. Protein C also forcomment: Protein C is synthesized in the liver as a single chain precursor, which is obin, which cleaves a dodecapeptide from the amino end of the heavy chain; this reaction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              м

                                                                                                                                                                                                                                                        trypsin (EC 3.4.21.4) II precursor, pancreatic (clone 2.P29) - chicken

N.Alternate names: trypsinogen II
C;Species: Gallus gallus (chicken)
C;Date: 23-Aug.1995 #sequence_revision 19-Oct-1995 #text_change 22-Jun-1999
C;Accession: $55066; $72347
R;Wang, K.; Gan, L.; Lee, I.; Hood, L.
B;Ochem. J. 307, 471-479, 1995
A;Title: Isolation and characterization of the chicken trypsinogen gene family.
A;Reference number: $55066
A;Molecule type: mRNA
